

### Summary:

Terms used throughout the merging documents

:= <-> "defined as"

Project := 'init'd or 'clone'd thing

Local project := the project we are merging something else into

Remote Project := the project we are using to merge into the local project

HEAD := pointer to the commit being view/used (active commit)

Mrca := most recent common ancestor

- Mrca: project -> project -> commit
- Mrca takes two projects and returns the commit in the merging project which is closest to its HEAD
- Examples

LL := local leaf

- The HEAD commit of the local project
- Local project := the project we are merging something else into

RL := remote leaf

- The HEAD commit of the remote project = the project we are using to merge into the local project
